Docket No.: 08211/0200248-USO

AMENDMENTS TO THE CLAIMS

1. (Previously Presented) An apparatus for generating a channelization code, comprising:

a binary counter circuit that is arranged to: receive a spreading factor signal and a clock signal, provide a binary count signal that is responsive to the clock signal, and reset the binary counter circuit when the binary count signal reaches a limit number that is associated with a spreading factor, wherein the spreading factor is associated with the spreading factor signal;

a code logic circuit that is arranged to: receive a code number signal and the spreading factor signal, and provide a right-justified code signal in response to the code number signal and the spreading factor signal, wherein the right-justified code signal corresponds to a right justified version of the code number signal;

a register circuit that is arranged to: receive the right-justified code signal and the clock signal, store the right-justified code signal in response to the clock signal, and provide the stored right-justified code signal as a stored code signal; and

a channelization logic circuit that is arranged to: receive the stored code signal and the binary count signal, and provide the channelization code in response to the stored code signal and the binary count signal such that the channelization code is associated with the code number and the spreading factor.

2. (Previously Presented) An apparatus for generating a channelization code, comprising:

a binary counter circuit that is arranged to: receive a spreading factor signal and a clock signal, provide a binary count signal that is responsive to the clock signal, and reset the binary counter circuit when the binary count signal reaches a limit number that is associated with a spreading factor, wherein the spreading factor is associated with the spreading factor signal, wherein the limit number is equal to the spreading factor minus one;

a code logic circuit that is arranged to: receive a code number signal and the spreading factor signal, and provide a right-justified code signal in response to the code number signal and the

4

Docket No.: 08211/0200248-US0

output, the counter output has a number of bits that is equal to a first number, the register circuit has a register output, the register circuit is configured to provide the stored code number at the register output, and wherein the register output has a number of bits that is equal to the first number.

7. (Original) The apparatus of Claim 6, wherein the channelization logic circuit comprises a number of logic gates that is approximately equal to twice the first number.

8. (Original) The apparatus of Claim 6, wherein the channelization logic circuit comprises a plurality of AND gate circuits, the channelization logic circuit further comprises a plurality of XOR gate circuits, the number of the plurality of AND gate circuits corresponds to the first number, and the number of the plurality of XOR gate circuits corresponds to the first number.

9. (Original) The apparatus of Claim 8, wherein each of the plurality of AND gate circuits has a first input, a second input, and an output, each of the plurality of AND gate circuits is configured to provide an AND output signal at the output of the AND gate circuit in response to a signal that is provided at the first input of the AND gate circuit and the second input of the AND gate circuit, each of the plurality of XOR gate circuits has a first input, a second input, and an output, each of the plurality of XOR gate circuits is configured to provide an XOR output signal at the output of the XOR gate circuit in response to a signal that is provided at the first input of the XOR gate circuit and the second input of the XOR gate circuit, the output of each AND gate circuit is coupled to first input of a corresponding XOR gate circuit, the first XOR gate circuit is configured to provide the channelization code at the output of the first XOR gate circuit, the output of each of the XOR gate circuits other than the first XOR gate circuit is coupled to the second input of the previous XOR gate circuit, the first input of the first of the plurality of AND gate circuits is coupled to a least significant bit of the counter output, the second input of the first of the plurality of AND gate circuits is coupled to a most significant bit of the register output, the first input of each subsequent AND gate circuit of the plurality of AND gate circuits is coupled to a next least significant bit of the counter output, and the second input of each subsequent AND gate circuit of the plurality of AND gate circuits is coupled to a next most significant bit of the register output.

Application No.: 10/644,125

5

Docket No.: 08211/0200248-USO

10. (Original) The apparatus of Claim 6, wherein the first number is eight such that the counter output comprises a counter bit 0, a counter bit 1, a counter bit 2, a counter bit 3, a counter bit 4, a counter bit 5, a counter bit 6, and a counter bit 7 such that the counter bit 7 is the most significant bit and the counter bit 0 is the least significant bit of the counter output, and wherein the register output comprises a register bit 0, a register bit 1, a register bit 2, a register bit 3, a register bit 4, a register bit 5, a register bit 6, and a register bit 7 such that the register bit 7 is the most significant bit and the register bit 0 is the least significant bit of the register output.

11. (Currently Amended) The apparatus of Claim 10, wherein the channelization logic circuit comprises:

a first AND gate having a first input, a second input, and ~~an a~~ first output, wherein the first input is coupled to the counter bit 7 and the second input is coupled to the register bit 0;

a second AND gate having a first input, a second input, and an output ~~a third input, a fourth input, and a second output~~, wherein the first input of the second AND gate ~~the third input is~~ coupled to the counter bit 6 and the second input of the second AND gate ~~the fourth input is~~ coupled to the register bit 1;

a third AND gate having a first input, a second input, and an output ~~a fifth input, a sixth input, and a third output~~, wherein the first input of the third AND gate ~~the fifth input is~~ coupled to the counter bit 5 and the second input of the third AND gate ~~the sixth input is~~ coupled to the register bit 2;

a fourth AND gate having a first input, a second input, and an output ~~a seventh input, a eighth input, and a fourth output~~, wherein the first input of the fourth AND gate ~~the seventh input is~~ coupled to the counter bit 4 and the second input of the fourth AND gate ~~the eighth input is~~ coupled to the register bit 3;

a fifth AND gate having a first input, a second input, and an output ~~a ninth input, a tenth input, and a fifth output~~, wherein the first input of the fifth AND gate ~~the ninth input is~~ coupled to the counter bit 3 and the second input of the fifth AND gate ~~the tenth input is~~ coupled to the register bit 4;

a sixth AND gate having a first input, a second input, and an output ~~a eleventh input, a twelfth input, and a sixth output~~, wherein the first input of the sixth AND gate ~~the eleventh input is~~

Application No.: 10/644,125

6

Docket No.: 08211/0200248-USO

coupled to the counter bit 2 and the second input of the sixth AND gate ~~the twelfth input~~ is coupled to the register bit 5;

a seventh AND gate having a first input, a second input, and an output ~~a thirteenth input, a fourteenth input, and a seventh output~~, wherein the first input of the seventh AND gate ~~the thirteenth input~~ is coupled to the counter bit 1 and the second input of the seventh AND gate ~~the fourteenth input~~ is coupled to the register bit 6;

a eighth AND gate having a first input, a second input, and an output ~~a fifteenth input, a sixteenth input, and a eighth output~~, wherein the first input of the eighth AND gate ~~the fifteenth input~~ is coupled to the counter bit 0 and the second input of the eighth AND gate ~~the sixteenth input~~ is coupled to the register bit 7;

a first XOR gate having a first input, a second input, and an output ~~a seventeenth input, an eighteenth input, and a first XOR output~~, wherein the first input of the first XOR gate ~~the seventeenth input~~ is configured to receive a signal having a voltage that corresponds to a logical level of zero, and the second input of the first XOR gate ~~the eighteenth input~~ is coupled to the output of the first AND gate ~~the first output~~;

a second XOR gate having a first input, a second input, and an output ~~a nineteenth input, a twentieth input, and a second XOR output~~, wherein the first input of the second XOR gate ~~the nineteenth input~~ is coupled to the output of the first XOR gate ~~the first XOR output~~, and the second input of the second XOR gate ~~the twentieth input~~ is coupled to the output of the second AND gate ~~the second output~~;

a third XOR gate having a first input, a second input, and an output ~~a twenty-first input, a twenty-second input, and a third XOR output~~, wherein the first input of the third XOR gate ~~the twenty-first input~~ is coupled to the output of the second XOR gate ~~the second XOR output~~, and the second input of the third XOR gate ~~the twenty-second input~~ is coupled to the output of the third AND gate ~~the third output~~;

a fourth XOR gate having a first input, a second input, and an output ~~a twenty-third input, a twenty-fourth input, and a fourth XOR output~~, wherein the first input of the fourth XOR gate ~~the twenty-third input~~ is coupled to the output of the third XOR gate ~~the third XOR output~~, and

{S:\08211\0200248-us0\80020234.DOC  }

Application No.: 10/644,125

7

Docket No.: 08211/0200248-US0

the second input of the fourth XOR gate ~~the twenty-fourth input~~ is coupled to the output of the
fourth AND gate ~~the fourth output~~;

a fifth XOR gate having a first input, a second input, and an output ~~a twenty-fifth input, a twenty-sixth input, and a fifth XOR output~~, wherein the first input of the fifth XOR gate ~~the twenty-fifth input~~ is coupled to the output of the fourth XOR gate ~~the fourth XOR output~~, and the second input of the fifth XOR gate ~~the twenty-sixth input~~ is coupled to the output of the fifth AND gate ~~the fifth output~~;

a sixth XOR gate having a first input, a second input, and an output a twenty-seventh input, a twenty-eighth input, and a sixth XOR output, wherein the first input of the sixth XOR gate the twenty-seventh input is coupled to the output of the fifth XOR gate the fifth XOR output, and the second input of the sixth XOR gate the twenty-eighth input is coupled to the output of the sixth AND gate the sixth output;

a seventh XOR gate having a first input, a second input, and an output ~~a twenty-ninth input, a thirtieth input, and a seventh XOR output~~, wherein the first input of the seventh XOR gate ~~the twenty-ninth input~~ is coupled to the output of the sixth XOR gate ~~the sixth XOR output~~, and the second input of the seventh XOR gate ~~the thirtieth input~~ is coupled to the output of the seventh AND gate ~~the seventh output~~;

a eighth XOR gate having a first input, a second input, and an output ~~a thirty-first input, a thirty-second input, and a eighth XOR output~~, wherein the first input of the eighth XOR gate ~~the thirty-first input~~ is coupled to the output of the seventh XOR gate ~~the seventh XOR output~~, the second input of the eighth XOR gate ~~the thirty-second input~~ is coupled to the output of the eighth AND gate ~~the eighth XOR output~~, and wherein the output of the eighth XOR gate ~~the eighth XOR output~~ corresponds to the channelization code output.

12. (Previously Presented) A method for producing a channelization code in response to a spreading factor and a code number, the method comprising:

comparing a binary count to a limit number;

incrementing the binary count in response to a clock signal when the binary count is less than the limit number;

{S:\08211\0200248-us0\80020234.DOC [REDACTED]}

Application No.: 10/644,125

8

Docket No.: 08211/0200248-US0

resetting the binary count when the binary count is equal to the limit number, wherein the limit number is related to the spreading factor;
evaluating a code number and the spreading factor;
right justifying the code number based on the spreading factor;
storing the right-justified code number as a stored code number; and
logically calculating the channelization code in response to the binary count and the stored code number.

13. (Previously Presented) A method for producing a channelization code in response to a spreading factor and a code number, the method comprising:

comparing a binary count to a limit number;
incrementing the binary count in response to a clock signal when the binary count is less than the limit number;
resetting the binary count when the binary count is equal to the limit number, wherein the limit number is related to the spreading factor;
evaluating a code number and the spreading factor, wherein the limit number is equal to the spreading factor minus one;
evaluating a code number and the spreading factor;
right justifying the code number based on the spreading factor;
storing the right-justified code number as a stored code number; and
logically calculating the channelization code in response to the binary count and the stored code number.

14. (Original) The method of Claim 12, wherein right-justifying the code number comprises:

determining a number of valid bits of the code number, wherein the number of valid bits of the code number corresponds to the base two logarithm of the spreading factor, and wherein the code number is a binary number;

{S:\08211\0200248-us0\80020234.DOC  }

Application No.: 10/644,125

9

Docket No.: 08211/0200248-US0

setting the most significant bit of the right-justified code number to the most significant valid bit of the code number;

for each remaining valid bit of the code number, setting the next most significant bit of the right-justified code number to the next most significant valid bit of the code number; and

setting the remaining bits of the right-justified code number to zero.

15. (Currently Amended) The method of Claim 12, wherein the binary count comprises a number of bits that is equal to a first number, the stored code number comprises a number of bits that is equal to the first number, and wherein logically calculating the channelization code comprises:

providing a first of a plurality of AND signals, wherein the first of the plurality of AND signals is provided such that the first of the plurality of AND signals corresponds to a logical level of one when a first condition is satisfied and the first of the plurality of AND signals bits corresponds to a logical level of zero when the first condition is not satisfied, and wherein the first condition is satisfied when a most significant bit of the binary count and the least significant bit of the stored code number both correspond to zero;

providing each subsequent AND signal of the plurality of AND signals, wherein each subsequent AND signal of the plurality of AND signals is provided such that the next of the plurality of AND signals corresponds to a logical level of one when a next condition is satisfied and the next of the plurality of AND signals bits corresponds to a logical level of zero when the next condition is not satisfied, and wherein the next condition is satisfied when a next most significant bit of the binary count and the next least significant bit of the stored code number both correspond to zero;

providing a first of a plurality of XOR signals, wherein the first of the plurality of XOR signals is provided such that the first of the plurality of XOR signals corresponds to a logical level of one when a first XOR condition is satisfied and the first of the plurality of XOR signals bits corresponds to a logical level of zero when the first XOR condition is not satisfied, and wherein the first XOR condition is satisfied when the first of the plurality of AND signals corresponds to a logical level of one;

{S:\08211\0200248-us0\80020234.DOC  }

Application No.: 10/644,125

10

Docket No.: 08211/0200248-USO

providing a next of the plurality of XOR signals, wherein the next of the plurality of XOR signals is provided such that the next of the plurality of XOR signals corresponds to a logical level of one when a next XOR condition is satisfied and the next of the plurality of XOR signals bits corresponds to a logical level of zero when the next XOR condition is not satisfied, the next XOR condition is satisfied when the next of the plurality of AND signals and the previous XOR signal each correspond to different logical levels, and wherein the last of the plurality of XOR signals corresponds to the channelization code.

16. (Original) An apparatus for generating a channelization code in response to a spreading factor and a code number, the apparatus comprising:

a means for counting that is configured to provide a binary count;

a means for resetting that is configured to reset the binary count when the binary count signal reaches a limit number, wherein the limit number corresponds to the spreading factor minus one;

a means for right justifying, wherein the means for right justifying is configured to right justify the code number in response to the spreading factor to provide a right-justified code number;

a means for storing, wherein the means for storing is configured to store the right-justified code number as a stored code number; and

a means for logically calculating that is configured to logically calculate the channelization code in response to the binary count and the stored code number.

17. (Currently Amended) An apparatus for generating a channelization code in response to a spreading factor and a code number, the apparatus comprising:

a means for counting that is configured to provide a binary count;

a means for resetting that is configured to reset the binary count when the binary count signal reaches a limit number, ~~wherein the limit number corresponds to the spreading factor minus one, wherein the binary count comprises a number of bits that is equal to a first number, and wherein the stored code number has a number of bits that is equal to the first number;~~

{S:\08211\0200248-us0\80020234.DOC [REDACTED] }

Application No.: 10/644,125

11

Docket No.: 08211/0200248-US0

a means for right justifying, wherein the means for right justifying is configured to right justify the code number in response to the spreading factor to provide a right-justified code number;

a means for storing, wherein the means for storing is configured to store the right-justified code number as a stored code number, wherein the limit number corresponds to the spreading factor minus one, wherein the binary count comprises a number of bits that is equal to a first number, and wherein the stored code number has a number of bits that is equal to the first number; and

a means for logically calculating that is configured to logically calculate the channelization code in response to the binary count and the stored code number.

18. (Original) The apparatus of Claim 17, wherein the means for logically calculating comprises logic gates, and wherein the number of logic gates is approximately equal to a second number, wherein the second number is twice the first number.

19. (Original) The apparatus of Claim 17, wherein the means for logically calculating comprises a plurality of means for providing an AND function, the means for logically calculating further comprises a plurality of means for providing an XOR function, the number of the plurality of means for providing an AND function corresponds to the first number, and the number of the plurality of means for providing an XOR function corresponds to the first number.

20. (Currently Amended) The apparatus of Claim 19, wherein each of the plurality of means for providing an AND function has a first input, a second input, and an output, each of the plurality of means for providing an AND function is configured to provide an AND output signal at the output of the means for providing an AND function in response to a signal that is provided at the first input of the means for providing an AND function and the second input of the means for providing an AND function, each of the plurality of means for providing an XOR function has a first input, a second input, and an output, each of the plurality of means for providing an XOR function is configured to provide an XOR output signal at the output of the means for providing an XOR function in response to a signal that
